Abstract

Research methods in economics and social sciences are evolving with the increasing availability of Internet and Big Data sources of information. As these sources, methods, and applications become more interdisciplinary, the 4th International Conference on Advanced Research Methods and Analytics (CARMA) is an excellent forum for researchers and practitioners to exchange ideas and advances on how emerging research methods and sources are applied to different fields of social sciences as well as to discuss current and future challenges. This edition was celebrated in a hybrid format because of the uncertainties created by pandemic.

Keywords: *Big Data sources, Web scraping Social media mining, Official Statistics, Internet Econometrics, Digital transformation, global society.*

1. Preface to CARMA2022

This volume contains the selected papers of the Fourth International Conference on Advanced Research Methods and Analytics (CARMA 2022) hosted by the Universitat Politècnica de València, Spain during 29 and 30 June 2022. This fourth edition consolidates CARMA as a unique forum where Economics and Social Sciences research meets Internet and Big Data. CARMA provides researchers and practitioners with an ideal environment to exchange ideas and advances on how Internet and Big Data sources and methods contribute to overcome challenges in Economics and Social Sciences, as well as on the changes in the society after the digital transformation.

The selection of the scientific program was directed by Maria Rosalia Vicente, who led an international team of 47 scientific committee members representing institutions worldwide. Following the call for papers, the conference received 58 paper submissions from all around the globe. All submissions were reviewed by the scientific committee members under a double-blind review process. Finally, 35 papers were accepted for oral presentation during the conference, ensuring a high-quality scientific program. It covers a wide range of research topics on the Internet and Big Data, including public opinion mining, web scraping, search engine data, tourism and mobility, social behavior, data economy, or marketing and social media, among others. Additionally, 11 papers with promising work-in-progress research were selected for presentation during the conference.

The scientific program includes two keynote speakers that will review the state-of-the-art techniques and applications of the Internet and Big Data. The first keynote address is given by Giuliano Resce (University of Molise, Italy) to overview the latest digital methods for Economics and Social Sciences. The second keynote speech is delivered by Fabian Braesemann (Oxford Internet Institute, UK) and deals with the Social Data Science in the Digital Economy.

CARMA 2022 also featured two special sessions on “Big Data in Central Banks” and “Internet and Big Data in Official Statistics,” chaired by Juri Marcucci and Aidan Condrón, respectively. Both sessions gave a complementary institutional perspective on how to use the Internet and Big Data sources and methods for public policy and official statistics.

The conference organizing committee would like to thank all who made this fourth edition of CARMA a great success. Specifically, thanks are indebted to the authors, scientific committee members, special session organizers, invited speakers, session chairs, reviewers, presenters, sponsors, supporters, and all the attendees. Our final words of gratitude must go to the Faculty of Business Administration and Management of the Universitat Politècnica de València for supporting CARMA 2022.

A visual analysis of the literature on Internet neutrality

Klaudijo Klaser¹, Lucía Desamparados Pinar García²

¹Università degli Studi di Trento, Dipartimento di Economia e Management, via Inama 5, 38122, Trento, Italy. ²University of Valencia, ERI-CES and Department of Economic Analysis, Av. de los Naranjos, s/n, 46022, Valencia, Spain.

Abstract

Internet neutrality – a principle against the discrimination between Internet data packages – has been one of the most debated Internet regulation policies in the last decade. However, this debate seems to be very fragmented and there is not a global comprehension of the direction of it. In this paper we try to fill this gap circumscribing the literature on Internet neutrality. Through the open-source software VOSviewer we provide a visual analysis of the relationship between the 50 most relevant words occurring in the abstracts of scientific publications on the topic in the last 15 years.

Keywords: *Internet, Literature Analysis, Net Neutrality, VOSviewer.*

1. Introduction

Internet (or net) neutrality has been the most relevant Internet regulatory policy of the last decade (Jacobides, 2020). The principle of net neutrality requires that all Internet data packages, regardless of their content, origin, destination, or type of equipment used, should be equally treated. (Wu, 2003). In general terms we can say that the debate on the need to set the obligation of net neutrality is between: on the one hand the Content Providers with strong market power (e.g. Amazon, Google, Meta, Netflix) which defend it under the argument of maintaining Internet as an open and global network that fosters innovation; and on the other hand the Internet Service Providers (e.g. Orange, Movistar, TIM, Vodafone) which argue that net neutrality discourages investments in maintenance and extension of network capacity because free rider behavior from the Content Providers side is allowed.

The academic results about the argument are often inconclusive and the regulatory policy sometimes contradictory¹. In other words, the literature about Internet neutrality seems to be very fragmented and there is a lack of comprehension of its global direction. Therefore, the inconsistency between the results often obtained in different fields of literature may explain the contentious and polemic debate that still continues on whether net neutrality is necessary and how to enforce it.

In this paper, through an analysis of the words occurring in the abstracts of scientific publications, we provide a global snapshot of the academic literature on net neutrality. We show that the debate is very interdisciplinary, involving law, economics, engineering and political sciences. However, in our analysis we found two dominant macro-areas of study in the literature: the economic debate and the legal perspective. We interpret this compartmentalization of fields as an absence of synergy between economic and legal outcomes, which adds complexity and generates confusion in the net neutrality debate.

In Section 2 we present the methodology employed to provide a visual analysis of the net neutrality literature. Section 3 presents the main results. Finally, conclusions are provided.

2. Method

On the database Web of Science² we looked for scientific publications which had the locution “internet neutrality” or “net neutrality” either in the title or in the abstract section.

¹ In 2015, the European Union incorporated regulations on net neutrality like the one established in the US between 2015 and 2017. In the European Union, since 2016, it is the Body of European Regulator for Economic Communications BEREC that manages the guidelines about net neutrality. In general terms, BEREC prohibits any type of quality discriminatory practice such as prioritization. However, certain financial discrimination practices such as zero-rating are allowed on a case-by-case basis. More recently, in September 2021, the Court of Justice of the European Union, by analyzing the cases of Vodafone and Deutsche Telekom in Germany, decided that zero rating offers (use of applications without data consumption) violate the net neutrality principle. This is a clear signal about how still confusing and hectic the debate is.

² Entered the 15th of February 2022.

This search produced a total of 368 available contributions, of which 264 articles, 52 proceeding papers and 26 book chapters. Only 296 publications resulted supplied with an abstract field³. For our analysis we focused on the co-occurrences of words within the abstracts.

Using a minimum threshold of occurrence of 10 times – counting also if a word appeared more than once within the same abstract – we identified a total of 175 possible relevant terms. Starting from that list of words we brainstormed and selected the most important ones given the context, that is Internet neutrality, according to standard procedures in the field (Caputo et al. 2021 and Donthu et al. 2021). Thus, even if some terms occurred very frequently, we excluded from the visual analysis 92 words which had no relevance given the context or which had a too general or ambiguous meaning, in the sense that they could be easily coupled with several other words in several different ways. For instance, we excluded words such as “analysis”, “content”, “decision”, “internet”, “issue” or “paper”.

In a second stage of refinement of the remaining 83 terms left we grouped the words with a coincidental or identical meaning. For example, we merged “commission” and “fcc” with “federal communications commission”, “Europe” with “European Union” and “law” with “legislation”. In the same way we decided to merge “costumer”, “consumer”, “end user”, “internet user” and “user” into one single category. This further refinement left us with 48 unique words with no ambiguity or synonyms plus other 10 words derived from merging 35 similar terms.

For the visual analysis of the network between the identified words we used the open-source software VOSviewer (van Eck and Waltman 2010, 2014).

3. Results

We first start with some general indexes and then we move to the network analysis.

3.1 General bibliometric indexes

Figure 1 shows the publication and citation history of the 368 contribution identified on Web of Science starting from 2006. As it is possible to notice from the bar chart, the literature on Internet neutrality constantly grew until 2018, when we can observe the pick for both the mentioned variables. Furthermore, the scientific production on the theme had a significant drop during the Covid years. On the one hand this might be a natural trend of many fields of research, because the focal center moved on the health emergency. On the other hand, this conspicuous drop is surprising given the importance that Internet had

³ Since the number of abstracts was relatively low we decided not to exclude any publication from the following analysis.

during the lockdown periods to carry out fundamental socio-economic activities and the consequent increase in traffic volumes (Feldmann et al. 2021).

Figure 1. Publications and citations over time, 2006-2022. Source: Web of Science, Citation report

Table 1 summarizes instead the main fields of literature of the publications according to the Web of Science categorization⁴. The research fields that mostly engage with the Internet neutrality debate are communication, telecommunication, information science, law, economics. Other 57 categories were present, but only less than nine contributions per category belonged to those areas. Therefore, they are not shown in Table 1.

3.2 Visual analysis of the network

Focusing on the relationship between the words present in the abstracts of the identified publications, we can notice (Fig. 2)⁵ that already after the first round of refinement – that is the elimination of non-significant words – we obtain a clear split of the 50 most relevant words in two macro-clusters (areas of research), mainly connected through the very central node represented by the term “neutrality”.

⁴ One publication can belong to more than one field, so there is the possibility of multiple counting.

⁵ For this visualization we used a binary counting of words, which counts only the number of documents in which a term occurs. The double or triple appearance of the same word within the same abstract is counted as one. Out of the 66 total words so identified we selected the 50 most relevant.

Table 1 – Web of Science main categories of the identified contributions

Field	Times
Communication	70
Telecommunications	66
Information Science Library Science	62
Law	60
Economics	49
Engineering Electrical Electronic	42
Computer Science Information Systems	33
Computer Science Hardware Architecture	27
Computer Science Theory Methods	23
Computer Science Software Engineering	20
Management	19
Polittical Science	13

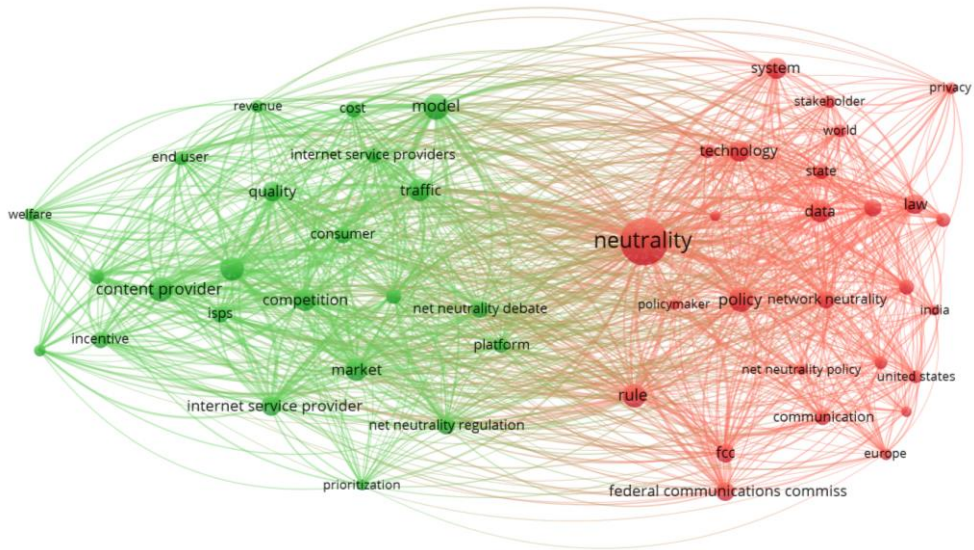

Figure 2. Network visualization of the 50 most relevant words, no merge of synonyms. Source: VOSviewer

The left cluster (green) contains words like “content provider”, “internet service provider(s)”, “market”, “model” and “competition”. This is a clear indication that one important part of the literature on Internet neutrality is basically focused on the normative (meant in an economic sense) configuration of the Internet market and the economic relationship between the main market actors. This is confirmed also by the co-presence of
